## LARGE CIRCLE TRAP FOR PECAN WEEVIL

Large circle traps are used to capture emerging pecan weevil in pecan trees. Place traps in trees prior to expected emergence.

Place trap on the north or west side of the tree and high on the trunk to protect them from cattle. Trap may be attached to the tree by either using drywall screws on the larger wood lathe and screwing into tree or secure by strapping material or bailing twine. The bottom of the screening is stapled or strapped to the tree. Twist lock top assembly into top of trap. Position wire by bending to ensure the bottom of the trap stays open for weevils to enter.

Traps need to be inspected regularly; insects removed and counted. Keep all spider webs cleaned from trap chamber entrance hole to ensure weevils have unrestricted pathway into top assembly.
